

FARMING PRACTICE  
MATTERS

# Regenerative Organic Farming

Regenerative Organic Viticulture is more important than we think - focusing on the microbiome of the soil, we nourish ecosystems that are not always visible to the eye. We focus on providing a living soil with a balanced ecosystem that nourishes and strengthens our vines. Just like our gut health supports a healthy body, when we get the soil balance right the whole landscape flourishes.

Keys to our healthy vines start each season with composting, probiotics, humates, cover crops and nutrition to put back into the soil. We focus on giving back more than we use after each harvest so our soils will be richer and more fertile for the next generation at Heath & Co.

Yes, we grow grapes and make amazing wine – but we grow so much more. Each year we sow peas, beans, clovers, fescue and encourage perennial native grasses to flourish providing ground shading, organic matter and ultimately nutrition for our vines giving us expressive wine grapes. A nourished ecosystem encourages life – flowers, bees, birds, and insects creating the complete picture of living for the land.
